

SGM9113 8MHz 5th Order Video Driver with 6dB Gain

PRODUCT DESCRIPTION

The SGM9113 is single rail-to-rail 5th order output reconstruction filter with a -3dB bandwidth of 8MHz and a slew rate of 35.7V/ μ s. Operating from single power supply ranging from 3.0V to 5.5V and sinking an ultra-low 7 mA quiescent current, the SGM9113 is ideally suited for low power, battery-operated applications.

The SGM9113 employs an internal level shift circuit that avoids sync-pulse clipping and allows DC-coupled output. It is specified over the extended -40°C to +85°C temperature range.

FEATURES

- **Excellent Video Performance**
- **5th Order Reconstruction Filter**
- **Internal Gain: 6dB**
- **Rail-to-Rail Output**
- **Input Voltage Range Includes Ground**
- **Operates on 3.0V to 5.5V Single Power Supply**
- **Low Power**
7 mA Typical Supply Current
- **Small Packaging**
Green SC70-5 (SOT-353) and SOP8 Packages

CAUTION

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

Applications Information

Functional Description

SGM9113 operates from a single 3.0V to 5.5V supply. In application, SGM9113 is a fully integrated solution for filtering and buffering SDTV signals in front of video decoder or behind video encoder. For example, SGM9113 can replace a passive LC filter and an amplifier driver at CVBS side in set-top box and DVD player, this solution can help you save PCB size and production cost, it also improves video signal performance comparing with traditional design using discrete components. SGM9113 features a DC-coupled input buffer, 5-pole low-pass filter to eliminate out-of-band noise of video encoder, and a gain of +6dB in the output amplifier to drive 75Ω load. The AC or DC-coupled input buffer eliminates sync crush, droop, and field tilt. The output of SGM9113 also can be DC-coupled or AC-coupled.

Input Considerations

Besides AC coupling, the SGM9113 inputs also can be DC-coupled. In DC coupling application, No input coupling capacitors are needed because the amplitude of input video signal from DAC includes ground and extends up to 1.4V, then SGM9113 can be directly connected to the output of a single-supply, current-output DAC without any external bias network. Some time, if DAC's output level exceeds the range of 0V to 1.4V, or SGM9113 is driven by an unknown external source or a SCART switch which has its own clamping circuit, AC coupling is needed in such applications.

Output Considerations

The SGM9113 outputs can be DC-coupled or AC-coupled. When 0V is input, the SGM9113 output voltage is 340mV typically. In DC coupling design, one 75Ω resistor is used to connect SGM9113's output pin with external load directly, this serial back-termination resistor is used to match the impedance of the transmission line between SGM9113 and external load to cancel the signal reflection. The SGM9113 outputs can sink and source current allowing the device to be AC-coupled with external load, in AC coupling, 220μF at least capacitor will be used in order to eliminate field tilt.

Power-Supply Bypassing and Layout

Correct power supply bypassing is very important for optimizing video performance in design. One 0.1μF and one 10μF capacitors are always used to Bypass V_{CC} pin of SGM9113, please place these two capacitors as close to the SGM9113 output pin as possible, a large ground plane is also needed to ensure optimum performance. The input and output termination resistors should be placed as close to the related pin of SGM9113 as possible to avoid performance degradation. The PCB traces at the output side should have 75Ω characteristic impedance in order to match the 75Ω characteristic impedance cable connecting external load. In design, please keep the board trace at the inputs and outputs of the SGM9113 as short as possible to minimize the parasitic stray capacitance and noise pickup.
